人工智能基础第三次编程 实验报告

自96 曲世远 2019011455

1.作业要求

本次编程作业要求使用手写数字图片中的白色像素数量作为每个数据点的特征值,进行Logistic回归计算,并利用梯度下降算法得到较优的模型,并对模型进行评价。

2.理论计算

推导使用随机梯度下降法求解一元Logistic回归的过程:

$$z = wx + b$$

$$h = \frac{e^z}{1 + e^z}$$

$$e = -y \log h - (1 - y) \log (1 - h)$$

$$\frac{de}{dh} = -\frac{y}{h} + \frac{1 - y}{1 - h} = \frac{h - y}{h(1 - h)}$$

$$\frac{dh}{dz} = \frac{e^z}{(1 + e^z)^2} = h(1 - h)$$

$$\frac{\partial z}{\partial b} = 1, \frac{\partial z}{\partial w} = x$$

$$\frac{\partial e}{\partial b} = h - y$$

$$\frac{\partial e}{\partial w} = (h - y)x$$

2.算法实现

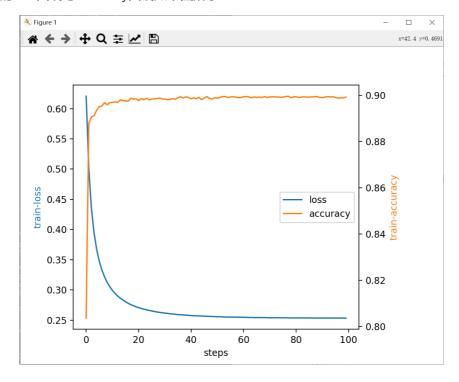

训练部分:

```
def train(w, b, X, Y, alpha=0.1, epochs=50, batchsize=32):
 2
 3
        Input random parameters w, b and features:X labels:Y\\
        Set the parameters alpha as learning rate, epochs and batchsize\\
        return trained w, b and recording the train loss and accuracy
 6
        .....
 8
        loss = np.zeros(epochs)
9
        acc = np.zeros(epochs)
10
        with tqdm(total = epochs) as t:
11
            for i in range(epochs):
                 '''split the dataset'''
12
                 random.seed(i)
13
14
                 index = [i for i in range(X.shape[0])]
15
                 random.shuffle(index)
16
                X = X[index]
                Y = Y[index]
17
                 '''train'''
18
```

```
19
                                                               acc_sum = 0
20
                                                                loss_sum = 0
21
                                                                for k in range(X.shape[0] // batchsize):
22
                                                                               X_{-} = X[k * batchsize : (k + 1) * batchsize]
23
                                                                               Y_{-} = Y[k * batchsize : (k + 1) * batchsize]
24
                                                                               Z = np.dot(w, X_) + b
25
                                                                               H = np.power(np.e, Z) / (1 + np.power(np.e, Z))
26
                                                                               Z_{-} = H > 0.5
27
                                                                               Y_{\_} = Y_{\_} == 1
28
                                                                               acc\_sum += (np.sum(Z\_ * Y\__) + np.sum(~Z_ * ~Y\__)) /
                 batchsize
29
                                                                               Deltab = np.mean(H - Y_)
                                                                               Deltaw = np.mean(np.dot(H - Y_, X_))
30
31
                                                                               loss_sum += np.mean(-Y_ * np.log(H) - (1 - Y_) * np.log(1 - Y_) + np.log
                 H))
32
                                                                               if k == X.shape[0] // batchsize - 1:
33
                                                                                               acc[i] = acc\_sum / (k + 1)
34
                                                                                               loss[i] = loss_sum / (k + 1)
35
                                                                                               t.set_postfix(loss = loss_sum / (k + 1))
36
                                                                                               t.update(1)
                                                                               w = w - Deltaw * alpha
37
38
                                                                               b = b - Deltab * alpha
39
40
                                return w, b, loss, acc
```

以上函数为训练函数,主要就是在batch内使用上一部分推导得到的梯度对参数w,b进行梯度下降运算,同时记录训练过程中的loss与accuracy。

训练过程中的loss曲线与accuracy曲线如下图所示:

测试部分:

```
def test(w, b, X, Y, threshold):
    """

Use trained parameters w, b with testfeature:X, test_labels:Y to evaluate the model
"""
```

```
print("w = \%.4f, b = \%.4f" \% (w, b))
 6
        Z = np.dot(w, X) + b
7
        H = np.power(np.e, Z) / (1 + np.power(np.e, Z))
8
        index_z_1 = (H > threshold)
9
        index_z_0 = (H < threshold)
        index_y_1 = (Y == 1)
10
11
        index_y_0 = (Y == 0)
12
        TP = np.sum(index_z_1 * index_y_1) / H.shape[0]
13
        FP = np.sum(index_z_1 * index_y_0) / H.shape[0]
14
        FN = np.sum(index_z_0 * index_y_1) / H.shape[0]
15
        TN = np.sum(index_z_0 * index_y_0) / H.shape[0]
16
        print(TP, FP, FN, TN)
17
        # Accuracy
        ACC = (TP + TN) / (TP + TN + FP + FN)
18
19
        # Balances error rate
20
        BER = 0.5 * (FP / (FP + TN) + FN / (FN + TP))
21
        # Matthew's correlation coefficient
22
        MCC = (TP * TN - FP * FN) / np.power((TP + FP) * (FP + TN) * (TN + FN) *
    (FN + TP), 0.5)
23
        # Sensitivity
        Sensitivity = TP / (TP + FN)
24
25
        # Specificity
26
        Specificity = TN / (TN + FP)
27
       # Recall
28
        Recall = TP / (TP + FN)
29
        # Precision
30
        Precision = TP / (TP + FP)
31
        # F1-measure
32
       F1 = 2 * Precision * Recall / (Precision + Recall)
33
34
        auROC = metrics.roc_auc_score(Y, Z)
35
        # auprc
36
        auPRC = metrics.average_precision_score(Y, Z)
```

以上代码为我的评价函数,主要是针对模型给出的预测结果与真实标签做对比并依据诸多参数给出评价。在epochs=100, alpha=0.05, bathcsize=16时,同时与sklearn的效果进行对比如下:

评价指标	My Model	sk-learn
Accuracy	0.8983	0.8983
Balance error rate	0.1029	0.1029
Matthew's correlation ccoeffiecient	0.7955	0.7955
Sensitivity	0.9145	0.9145
Specificity	0.8796	0.8796
Recall	0.9145	0.9145
Precision	0.8979	0.8979
F1-measure	0.9062	0.9062
auROC	0.9538	0.8971
auPRC	0.9566	0.8670

下面代码为我使用sklearn部分的代码:

```
def train_sklearn(X, Y, X_test, epochs):
2
        #print(X.shape, Y.shape, X_test)
 3
        skmodel = LogisticRegression(penalty = 'none', max_iter = epochs)
        skmodel.fit(X.reshape(-1, 1), Y.reshape(-1, 1))
 4
 5
        Z = skmodel.predict(X_test.reshape(-1, 1))
        return Z
 6
 7
8
    def test_sklearn(Z, Y, threshold):
9
        print("-----")
10
        index_z_1 = (z > threshold)
11
        index_z_0 = (z < threshold)
12
        index_y_1 = (Y == 1)
13
        index_y_0 = (Y == 0)
14
        TP = np.sum(index_z_1 * index_y_1) / z.shape[0]
15
        FP = np.sum(index_z_1 * index_y_0) / z.shape[0]
16
        FN = np.sum(index_z_0 * index_y_1) / Z.shape[0]
17
        TN = np.sum(index_z_0 * index_y_0) / z.shape[0]
        print(TP, FP, FN, TN)
18
19
        # Accuracy
        ACC = (TP + TN) / (TP + TN + FP + FN)
20
21
        print("ACC = %.4f" % ACC)
22
        # Balances error rate
23
        BER = 0.5 * (FP / (FP + TN) + FN / (FN + TP))
24
        print("BER = %.4f" % BER)
```

```
25
    # Matthew's correlation coefficient
